

AFRi Marigold Accessory

Initial Concepts — Stage One

Three provisional approaches to dividing a single marigold into two separate pieces that reassemble into one complete flower.

These concepts are provisional. AFRi's reference material was not available when they were produced, so the colours, proportions and construction shown here are studio assumptions, not brand specifications. No claim is made that they match AFRi's existing design language.

The design objective

The accessory is a single marigold made in two separate pieces. Apart, each piece is a complete object in its own right. Brought together, they reconstruct one whole flower, with the line of the division reading as a deliberate part of the design rather than a seam.

All three concepts are cut from the **same master flower**. Only the dividing line differs between them, so the comparison is a fair one: what changes from concept to concept is the division itself, not the flower.

Confirmed requirement	
1	The accessory is a marigold.
2	It is made in two separate pieces.
3	Together the pieces form one complete flower.
4	Several ways of dividing the flower are to be explored.
5	An S-shaped, river-inspired division is a priority.
6	It will sit on a hat brim (a later stage, not shown here).

Concept A Balanced Split

A clear, near-symmetric division. The dividing line reads as a single confident stroke across the rosette.

Assembled flower

The two components, separated

Detail of the division

Version 6 · 157 petals in 7 rows · 93.65 mm across, 19.18 mm deep · piece balance 0.5007 · validation 17/17

Three-quarter view

Side elevation

Concept B S River Split

The client's priority concept: a flowing S-shaped, river-inspired separation with an editable curve.

Concept C Organic Asymmetric

An expressive, irregular division that wanders with the petal arrangement. The two pieces are deliberately unequal.

Next steps

Please select a direction, or tell us which elements of each you would like combined. Every parameter shown is adjustable: petal count and density, depth of relief, the shape and position of the dividing line, and the finish.

What we would like from you

1. A preferred concept, or a combination.
2. AFRi's reference material, so the provisional assumptions can be replaced with your actual design language.
3. The intended finished size and the material you have in mind.
4. Confirmation to proceed to the hat stage, where the approved flower is placed on the brim and the attachment is worked out.

Scope and caveats. These are digital design concepts. The hat is not modelled and no attachment mechanism has been designed — that is deliberately a later stage. Manufacturing feasibility has not been assessed: wall thickness, tolerances and process constraints all remain open. The colours are provisional and are not AFRi brand colours.
